Jonathan Fils-Aime

We've implemented the program where the user is asked to input an operation. The operation has to be valid. A valid operation is as follows [operand operator operand] i.e. 1 + 2. This calculator only computes addition and subtraction. If the user inputs an invalid character the program will display an error message with the character violation. After computing the amount the program loops back to the beginning. Below is our state machine.

Total = T
Operand = N
Operator = L
Character = C
